# What Every Computational Physicist Should Know About Computer Architecture\*

\*Plus some other useful technology

Ian Cosden, Princeton University Steve Lantz, Cornell University

CoDaS-HEP Summer School, August 1, 2022

## Outline

- Motivation
- HPC Cluster
- Compute
- Memory
- Disk
- Other Architectures

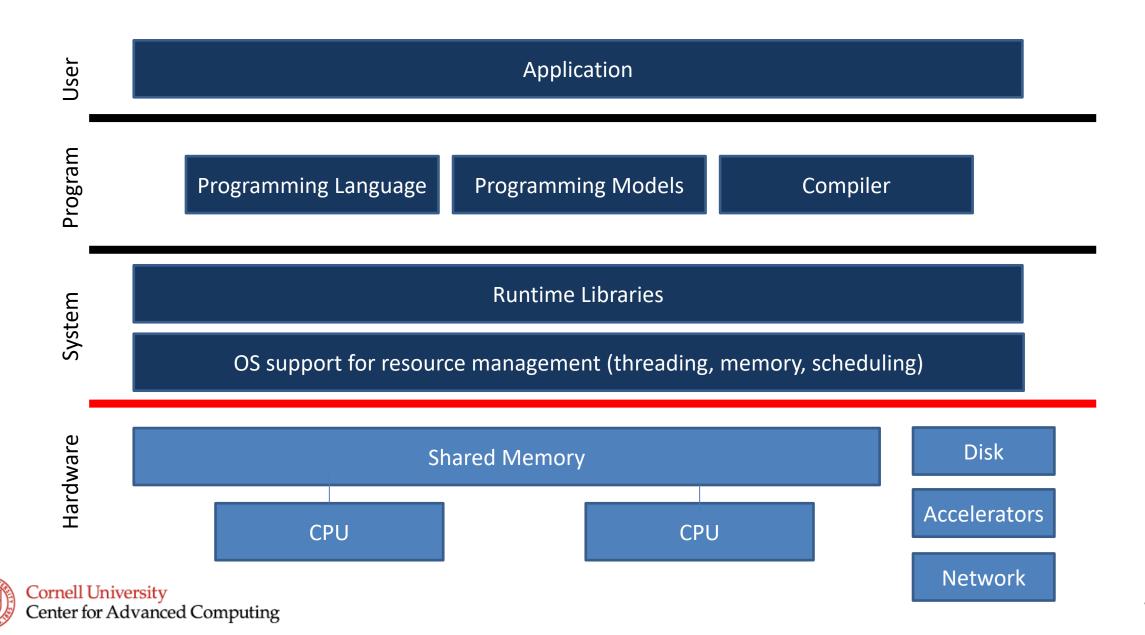

## Why Care About the Hardware?

- Get the most out of this week
- Be able to ask better questions and understand the answers
- Architecture changes can force new design and implementation strategies
  - Prevent programming mistakes
  - Make educated decisions
- Exploit the hardware to your advantage (performance)

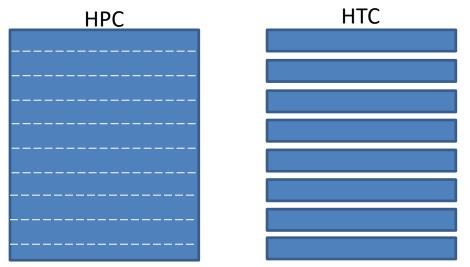

#### Hardware is the Foundation

## Why Care About HPC Hardware?

- High-Performance Computing (HPC)
  - Aggregate computing power in order to deliver far more capacity than a single computer
  - Supercomputers
- Some problems demand it from the onset; <u>many</u> problems evolve to need it
  - When you outgrow your laptop, desktop, departmental server
  - Ask: do you need greater capability, or just capacity?
  - Either way, HPC clusters run lots of High-Throughput Computing (HTC) jobs

### Moore's Law

count

Transistor

- Number of transistors doubles ever 18-24 months
- More transistors = better, right?

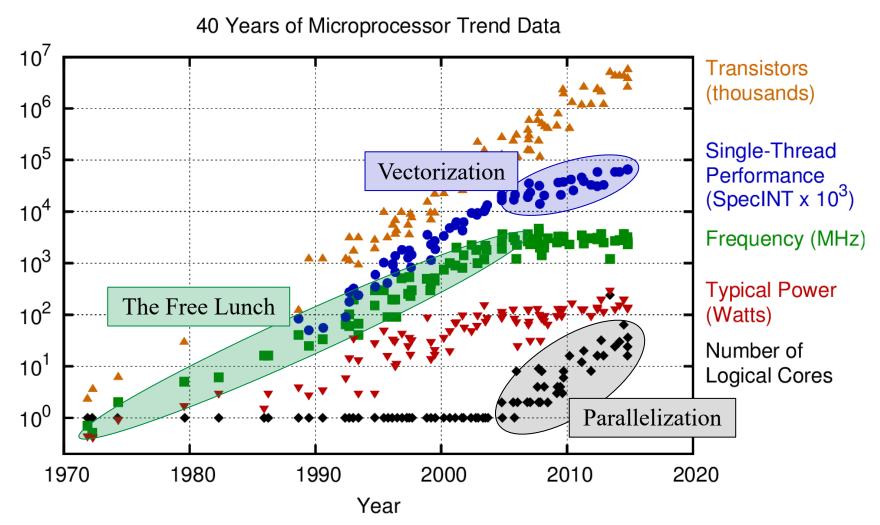

16-Core SPARC T3 Six-Core Core i7 Six-Core Xeon 7400-2,600,000,000 10-Core Xeon Westmere-EX Dual-Core Itanium 2 @ -core POWER7 Ouad-core z196 AMD K10 ad-Core Itanium Tukwila 1,000,000,000 POWER6 Core Xeon Nehalem-EX Itanium 2 with 9MB cache AMD K10 Core i7 (Ouad ore 2 Duo Itanium 2 🖷 100,000,000 €AMD K8 Barton Atom Pentium 4 AMD K7 curve shows transistor count doubling every AMD K6 10,000,000 Pentium III two years Pentium II AMD K5 Pentium 80486 1,000,000 80386 80286 100,000 68000 80186 8086 \$ 8088 10,000 6800 6809 8008 MOS 6502 2,300 4004 RCA 1802 2011 1990 2000 1980 1971

Microprocessor Transistor Counts 1971-2011 & Moore's Law

#### The Free Lunch is Over

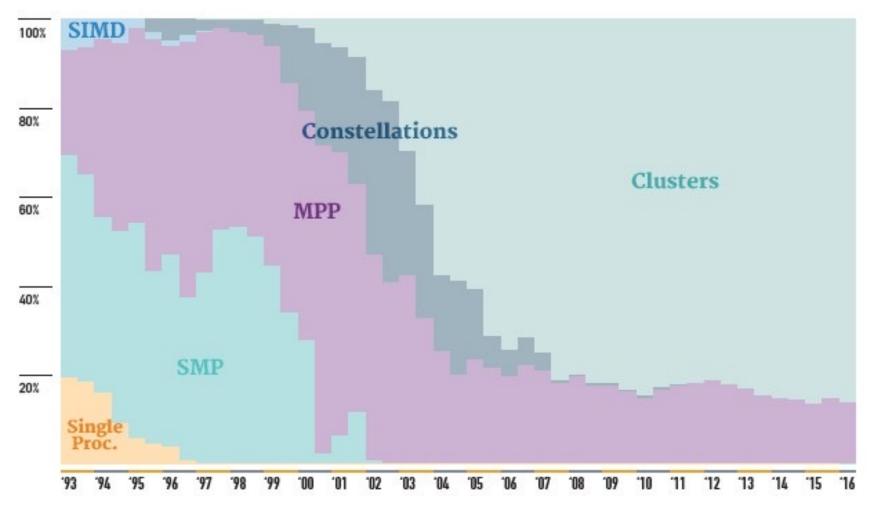

Original data up to the year 2010 collected and plotted by M. Horowitz, F. Labonte, O. Shacham, K. Olukotun, L. Hammond, and C. Batten New plot and data collected for 2010-2015 by K. Rupp

### Why Talk About Intel Architecture?

## Outline

- Motivation
- HPC Cluster
- Compute
- Memory
- Disk
- Other Architectures

## Zoom In On A Cluster

- A <u>cluster</u> is just *connected* collection of computers called <u>nodes</u>
- The high-speed network that connects the cluster is called the interconnect
- A single, unconnected node is usually just called a server
- Entire clusters, as well as stand-alone servers, are sometimes referred to as <u>machines</u>

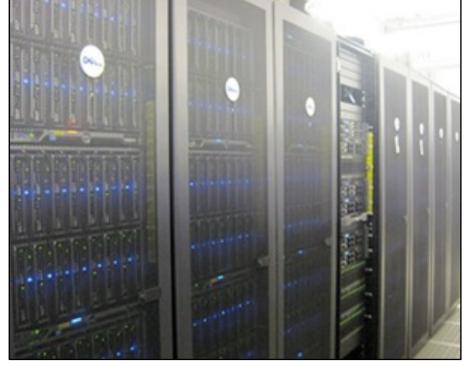

## **Parallel Computers**

#### HPC Cluster: the vast majority of HPC systems

- A collection of servers connected to form a single entity
  - Each is essentially a self-contained computer
  - OS with CPU, RAM, hard drive, etc.
- Stored in racks in a dedicated machine room
- Networked together a via low-latency interconnect
  - Ethernet < InfiniBand, Omni-Path (Intel)
- Interconnect extends to shared storage

SMP System: Symmetric Multi-Processing

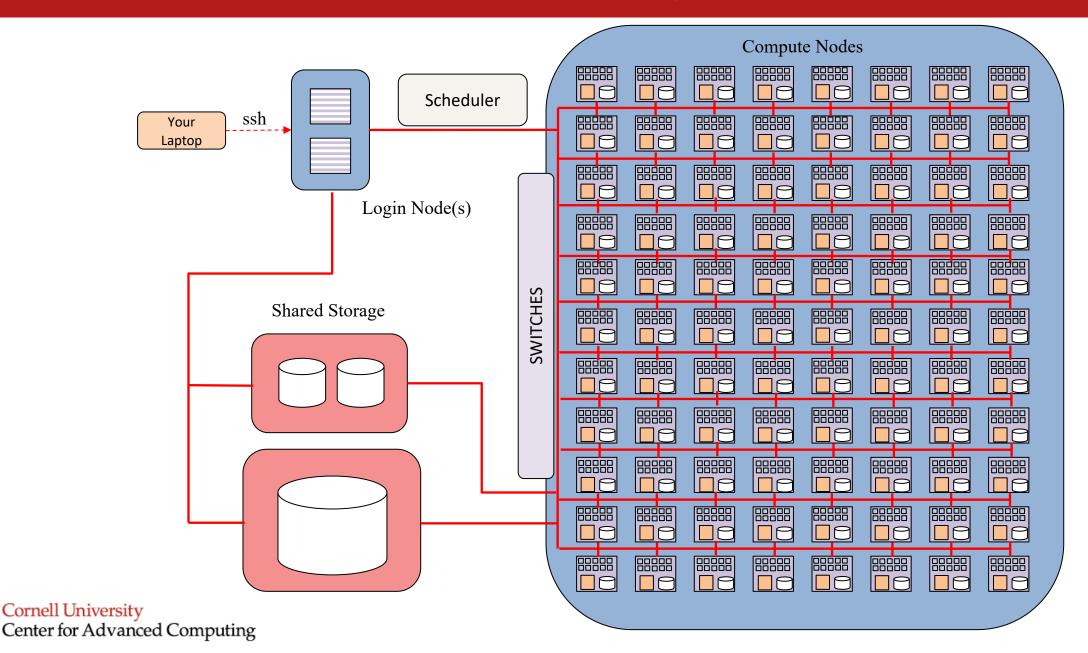

- CPUs all share memory essentially one computer
- Expensive, likely needed for a unique purpose
  - Huge memory, huge OpenMP jobs

Princeton's Della Cluster

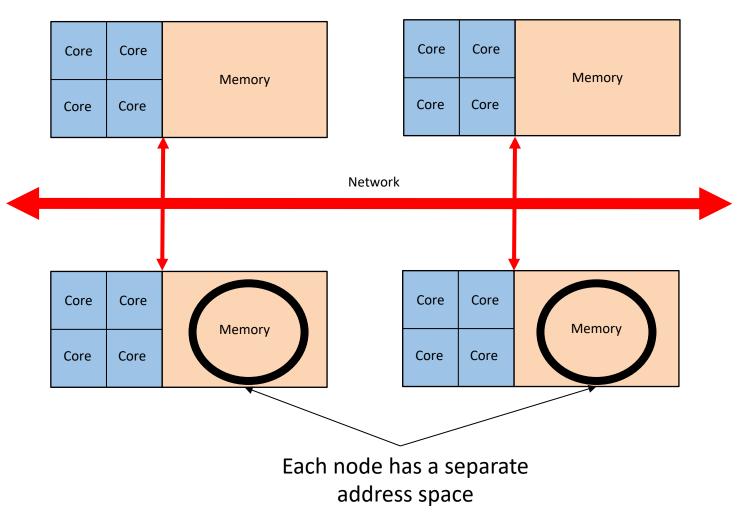

#### **Basic Cluster Layout**

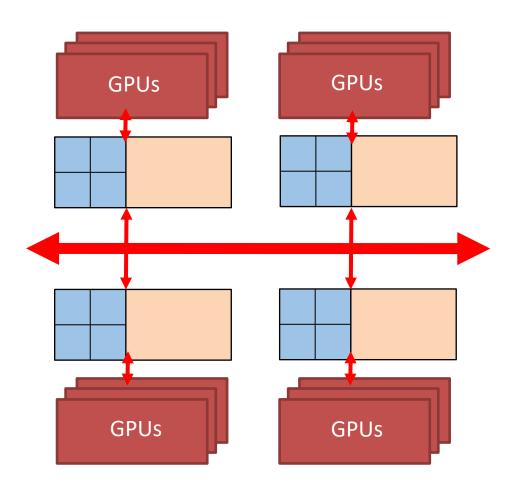

### Nodes Are Discrete Systems

- Memory address space
  - Range of unique addresses
- Separate for each node
- Can't just access all memory in cluster

## **Clusters With Accelerators**

- "Heterogeneous" system architecture
- Accelerators: GPUs, typically
  - Or FPGAs, etc.
  - Node can have multiple accelerators
- Programmable with MPI + x
  - Where x = OpenMP, OpenACC, CUDA, …
- Increases computational power
  - Increases FLOPS / Watt
- Trending in Top500.org
  - Strong shift toward systems with accelerators started ~10 years ago

## Outline

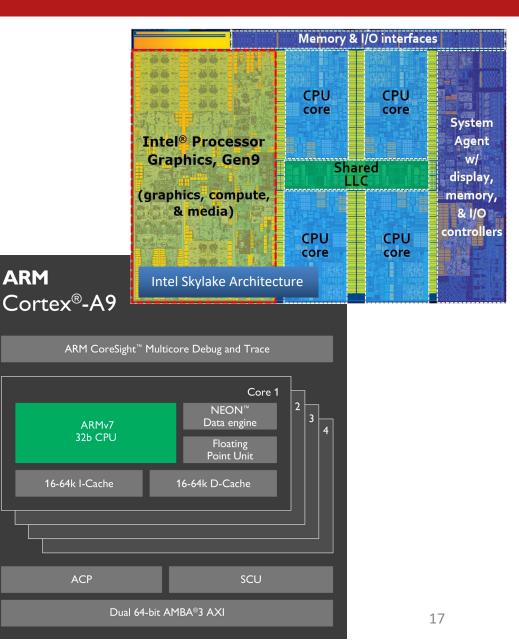

- Motivation
- HPC Cluster
- Compute
- Memory
- Disk
- Other Architectures

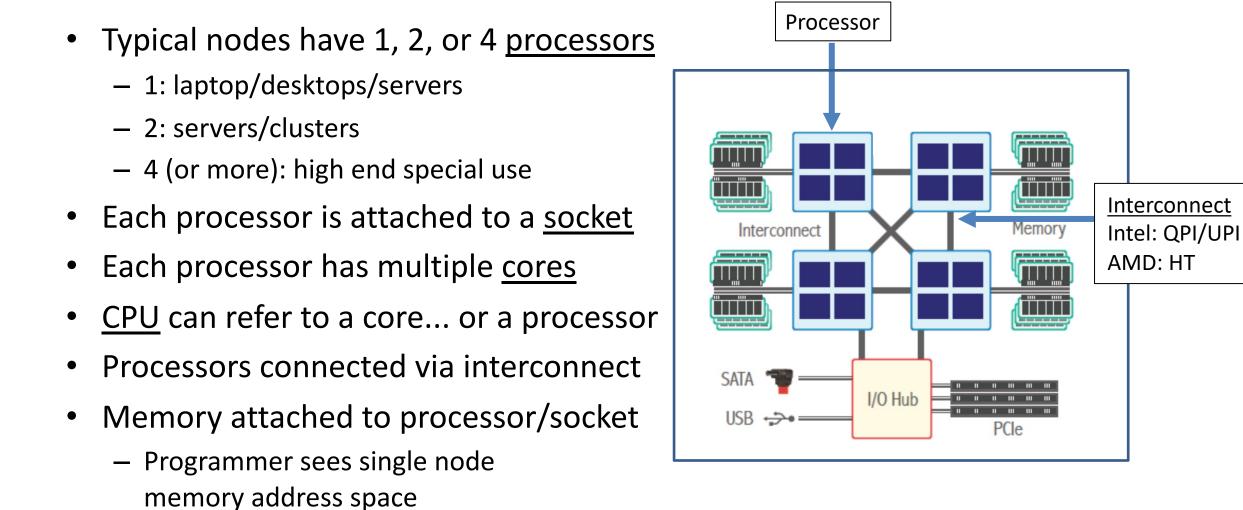

## **Multicore Processors**

- Nearly all modern processors are multicores
  - In servers: Intel Xeon, AMD EPYC, IBM Power
  - In laptops: Intel, AMD, ARM
  - In GPUs, phones, and mobile devices as well
- Most have vector units, multiple cache levels
- Require special care to program
  - Multi-threading, vectorization, ...
  - The free lunch is over!
- Instruction sets can vary
  - Intel and AMD: x86\_64 base, not identical
  - IBM Power, ARM, NVIDIA, etc. all differ

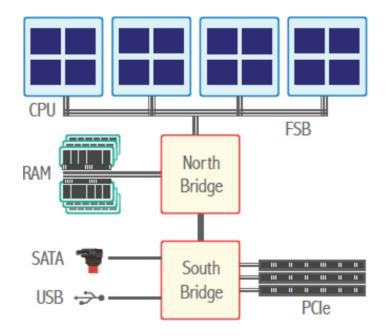

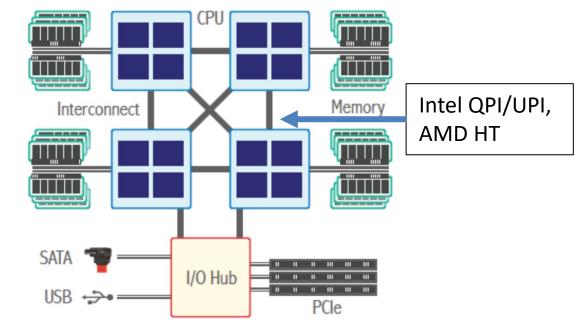

## Motherboard Layout

### Motherboard Layouts, Past and Present

#### Symmetric MultiProcessing (SMP) -

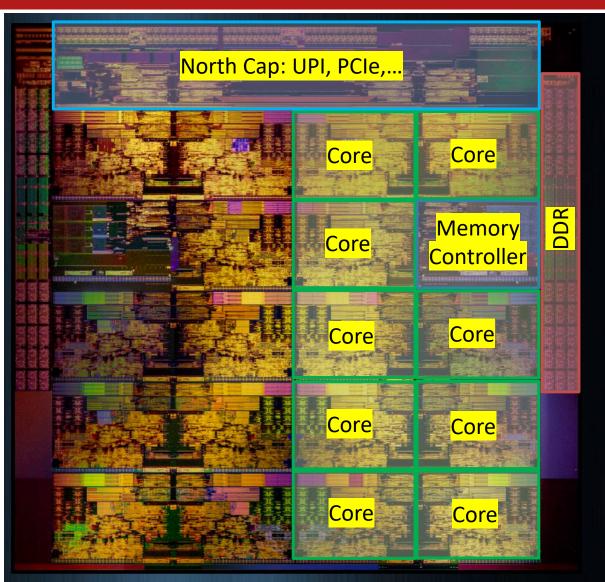

Memory access is uniform, as all traffic goes via north bridge, but is bottlenecked by front side bus (FSB) and north-bridge-to-RAM bandwidth limitations. Current motherboards have no north bridge; the south bridge is now referred to as the I/O hub or just the chipset.

#### Non-Uniform Memory Access (NUMA) –

Physical memory is partitioned per CPU, with a fast interconnect to link CPUs to each other and to I/O. This removes bottlenecks but memory is no longer uniform – there may be 30-50% extra latency to access remote memory, more in multi-hop systems.

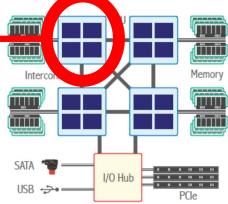

## Example: Intel Skylake Scalable Processor

"System on a Chip" (SoC)

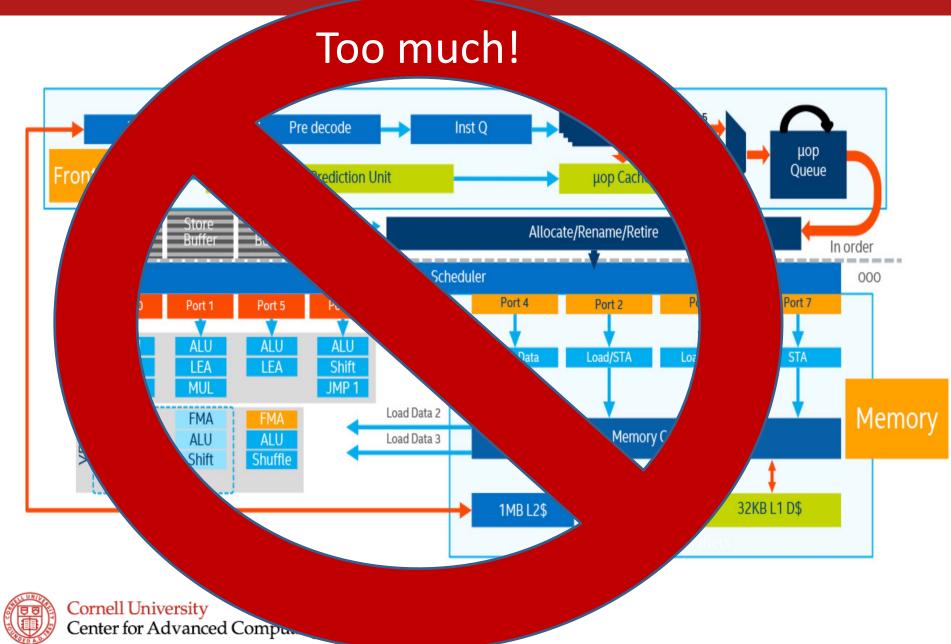

- Core: "A complete ensemble of execution logic, and cache storage as well as register files plus instruction counter (IC) for executing a software process or thread." (Jarp)
- UPI Intel Ultra Path Interconnect
- PCIe Peripheral Component Interconnect Express
- DDR Double Data Rate

Cornell University Center for Advanced Computing

## Skylake Core Microarchitecture

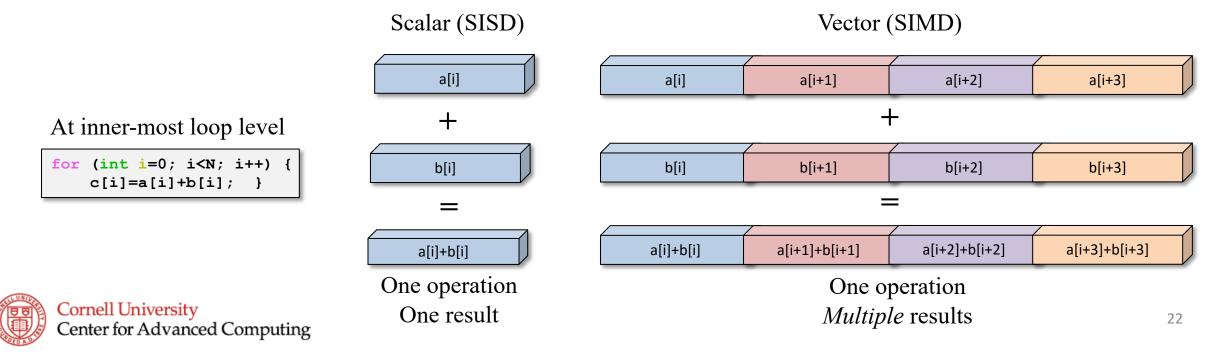

#### Key Components:

Control logic Register file Functional Units

- ALU (arithmetic and logic unit)
- FPU (floating point unit)
- Data Transfer
- Load / Store

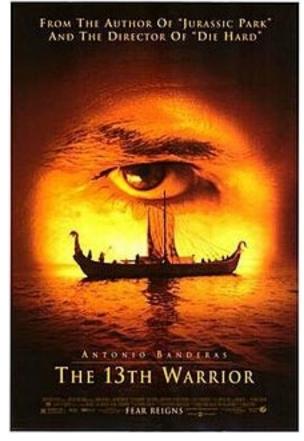

#### **Vectorization Terminology**

- New generations of CPUs add capabilities and instructions
  - Each core can have one or more vector processing units (VPUs) and vector registers
  - Machine (assembly) commands are often added to take advantage of new hardware
- Vector instructions are also called SIMD = Single Instruction Multiple Data
  - x86\_64 has <u>Streaming SIMD Extensions</u> (SSE), <u>A</u>dvanced <u>Vector Extensions</u> (AVX)

## **HPC Performance Metrics**

- FLOP = <u>Fl</u>oating-point <u>Op</u>eration
  - FLOPs = <u>Floating-point Operations</u>
  - FLOPS = <u>Floating-point</u> <u>Operations</u> <u>Per</u> <u>Second</u>
  - Often write FLOP/s or FLOP/sec to avoid ambiguity
- Calculation for single processor
  - Typically Double Precision (64-bit)
  - FLOPS = (Clock Speed)\*(Cores)\*(FLOPs/cycle)
- FLOPS/\$, FLOPS/Watt are useful metrics too
- Bandwidth metrics ("giga" usually means 10<sup>9</sup>)
  - GB/s = gigabytes/sec
  - Gb/s = gigabits/sec

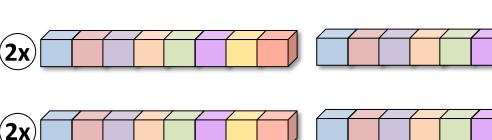

N.B. - not to be confused with a Hollywood flop!

## Intel Xeon (Server) Architecture Codenames

- Number of FLOP/s depends on width, number, and abilities of VPUs in a core
- Per-core rates, double precision (64-bit doubles twice this for 32-bit floats)
  - Pentium 4\*... Nehalem/Westmere (SSE2... SSE4):
    - 4 DP FLOPs/cycle: 128-bit addition + 128-bit multiplication
  - Sandy Bridge/Ivy Bridge (AVX)
    - 8 DP FLOPs/cycle: 256-bit addition + 256-bit multiplication
  - Haswell/Broadwell (AVX2)
    - 16 DP FLOPs/cycle: **two**, 256-bit **FMA**, fused multiply-add **(2x)**
  - KNL/Skylake (AVX-512)
    - 32 DP FLOPs/cycle: **two**\*\*, 512-bit **FMA**
  - Cascade Lake (AVX-512 VNNI with INT8)
    - 32 DP FLOPs/cycle: two, 512-bit FMA

\*Pentium III (1999) introduced 128-bit SSE for 4 single-precision floats \*\*Some Skylake-SPs can do only one 512-bit FMA = (a × b + c), per core

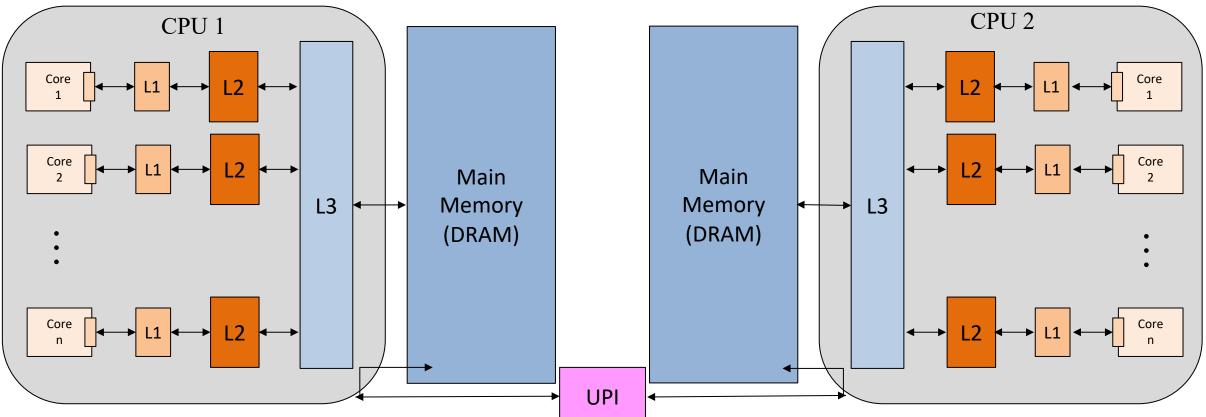

## Outline

- Motivation
- HPC Cluster
- Compute
- Memory
  - Layout
  - Cache
  - Performance
- Disk
- Other Architectures

## Memory Hierarchy

Dual Socket Intel Xeon CPU

		Registers	L1 Cache	L2 Cache	L3 Cache	DRAM	Disk
	Speed	1 cycle	~4 cycles	~10 cycles	~30 cycles	~200 cycles	10ms
Cornell	Size	< KB per core	~32 KB per core	~256 KB per core	~35 MB per socket	~100 GB per socket	ТВ

## Growth in Memory Performance Lags CPU

If your data is served by RAM and not caches it doesn't matter if you have vectorization.

#### To increase performance, try to minimize memory footprint.

http://web.sfc.keio.ac.jp/~rdv/keio/sfc/teaching/architecture/architecture-2008/hennessy-patterson/Ch5-fig02.jpg

Center for Advanced Computing

Performance

## Outline

- Motivation
- HPC Cluster
- Compute
- Memory
- Disk
  - Types
  - Filesystems
- Other Architectures

## File I/O

"A supercomputer is a device for turning compute-bound problems into I/O-bound problems."

-- Ken Batcher, Emeritus Professor of Computer Science at Kent State University

## Types of Disk

- Hard Disk Drive (HDD)
  - Traditional Spinning Disk
- Solid State Drives (SSD)
  - ~5x faster than HDD
- Non-Volatile Memory Express (NVMe)
  - ~5x faster than SSD

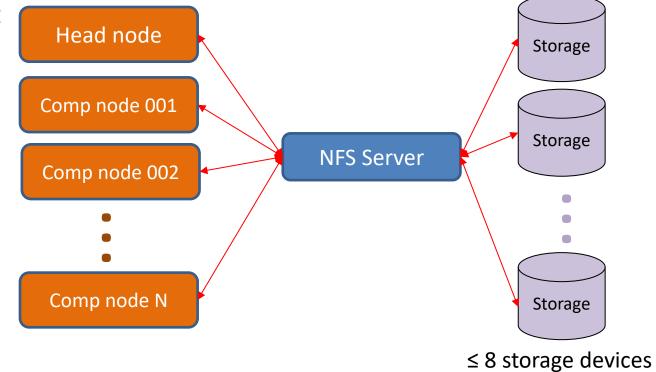

Photo Credit: Maximum PC

## Types of Filesystems - NFS

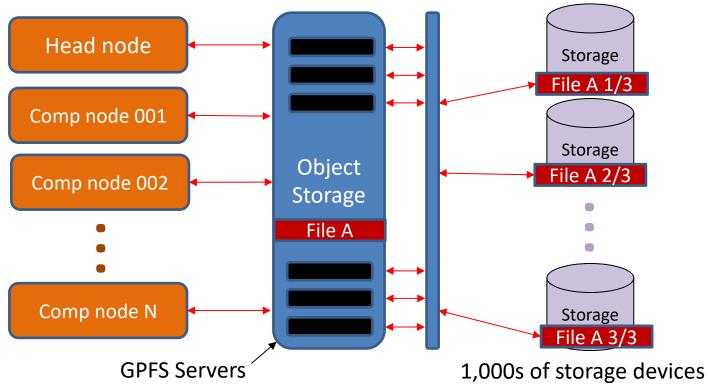

- NFS Network File System
  - Simple, cheap, and common
  - Single filesystem across network
  - Not well suited for large throughput

## Parallel Filesystems

- GPFS (General Parallel Filesystem IBM)
  - Designed for parallel read/writes
  - Large files spread over multiple storage devices
  - Allows concurrent access
  - Significantly increase throughput
- Lustre
  - Similar idea
  - Different implementation
- Parallel I/O library in software
  - Necessary for performance realization

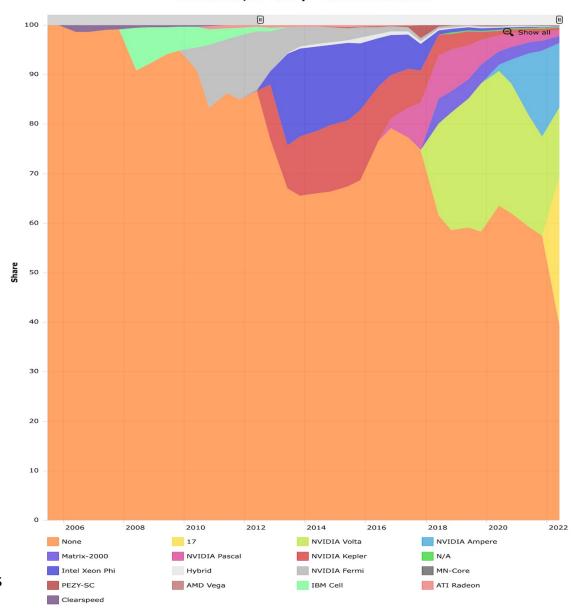

## Outline

- Motivation
- HPC Cluster
- Compute
- Memory
- Disk
- Other Architectures
  - GPUs
  - Xeon Phi
  - Cloud

#### Heterogeneous Systems on the Rise

- The computing landscape changes rapidly
- 60% of TOP500 systems now have accelerators (June 2022)
- Graphics processing units (GPUs) are by far the most common type of accelerator

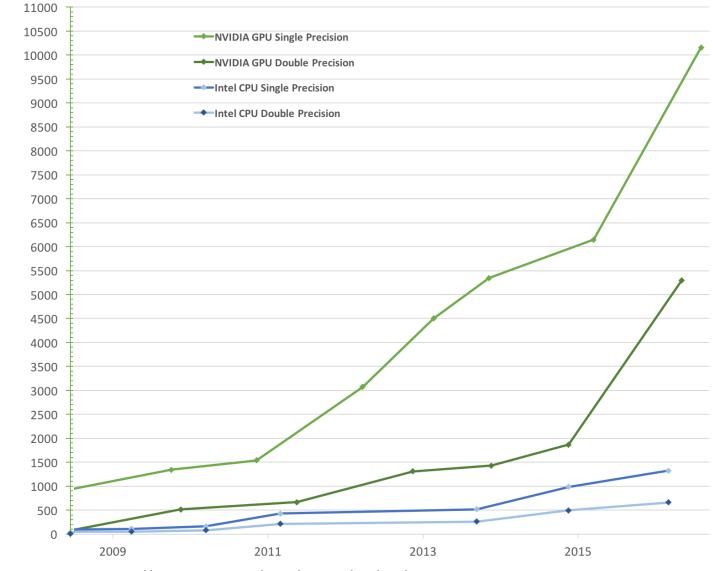

Accelerator/CP Family - Performance Share

https://www.top500.org/statistics

## GPU and CPU Performance Trends

Theoretical GFLOP/s at base clock

https://docs.nvidia.com/cuda/archive/9.1/pdf/CUDA\_C\_Programming\_Guide.pdf

## General Purpose GPUs

- General Purpose GPU (GPGPU)
  - NVIDIA Pascal/Volta/Ampere...
  - AMD Radeon Instinct, others
- Always attached to a CPU host
  - Data travels to device over PCIe
  - NVIDIA NVLink has higher speed
- Not compatible with x86
- Programmable sort-of-like CPUs
  - NVIDIA CUDA: extensions to C++
  - OpenCL, OpenACC, OpenMP, ...
  - Need compatible compiler, libraries

#### NVIDIA Volta V100

## NVIDIA Tesla V100 (V for "Volta")

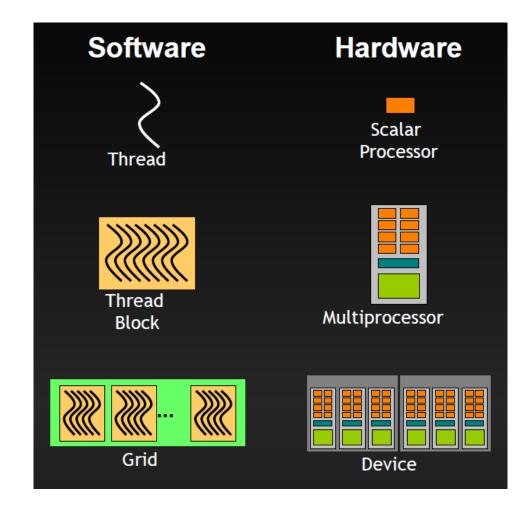

- 80 Streaming Multiprocessors (SMs)
  - Analogous to CPU cores
  - Execute only SIMD-type instructions
- One SM holds many "CUDA cores"
  - Analogous to vector lanes
  - 64 FP32 CUDA cores
  - 64 INT32 CUDA cores
  - 32 FP64 CUDA cores
- One SM also has 8 tensor cores
  - Fast 4x4 matrix multiplications in FP16
- Device memory: 32 GB of HBM2

## **NVIDIA Execution Model**

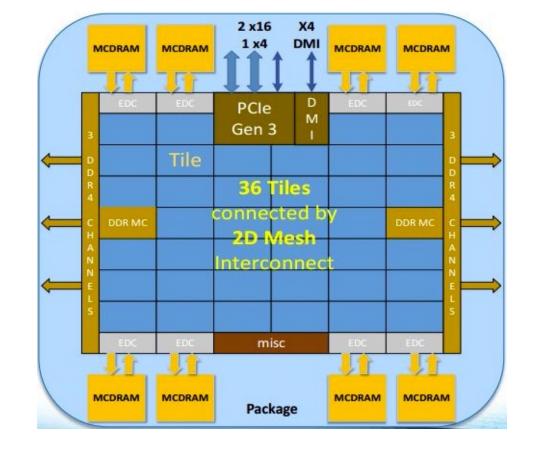

- SIMT = Single Instruction Multiple Thread
  - Operations apply to "warps" of 32 threads
  - A warp of threads is like a CPU vector
  - Not all that different from SIMD
- CUDA core = scalar (thread) processor
  - Instructions only go to groups of 32
  - A thread block must be split into warps of 32
  - Thus, an SM is like 1 or 2 vector units in a CPU
- One thread block maps to one SM
- A grid of thread blocks can be spread over the entire device

## R.I.P. Intel Xeon Phi, a.k.a. Intel MIC

- MIC: Many Integrated Cores
  - x86-compatible multiprocessor architecture
- Programmable just CPUs
  - MPI, OpenMP, OpenCL, ...
  - Same compilers as CPUs
- But many cores, fast MCDRAM like GPUs
  - Intel's "answer" to the GPU challenge
- Started out as a coprocessor
  - Data travels over PCIe
  - Became main processor in 2nd generation
- Eventually merged into Xeon line

#### M. Lefebvre

#### Processors vs. PCIe Devices, Circa 2019

	Xeon Gold 5122 (2017)	Xeon Platinum 8280M (2019)	Xeon Phi 7290F (2017)	NVIDIA V100 (2017)
Cores	4	28	72	84 SMs
Logical Cores	8	56	288	5120 cores
Clock rate	3.6 – 3.7 GHz	2.5 – 3.8 GHz	1.5-1.7 GHz	1530 MHz
Theoretical GFLOPS (double)	460.8	2240	3456	7450
SIMD width	512 bit	512 bit	512 bit	Warp of 32 threads
Memory			16 GB MCDRAM 384 GB DDR4	32 GB
Memory B/W	127.8 GB/s	127.8 GB/s	400+ GB/s MCDRAM 115.2 GB/s RAM	900 GB/s
Approx. Unit Price	\$1,200	\$12,000	\$3,400	\$9,000

## Demystifying the Cloud

- "Regular" computers, just somewhere else
- Provide users with remote virtual machines or containers
- Can be used for anything:
  - Mobile services, website hosting, business applications, ...
  - Data analysis, high performance computing
- Providers
  - Amazon Web Services (AWS)
  - Microsoft Azure
  - Google Cloud Platform (GCP)
  - Oracle Cloud
  - Lots of others

## Cloud Computing Pros and Cons

- Advantages:
  - Potentially lower cost
    - Pay as you go
    - Save on sysadmins and infrastructure
    - Economy of scale
  - Scaling up or down as needed
    - Can be used to run overflow from a regular data center
  - Access to a wide range of hardware
- Challenges:
  - Data movement
    - Expensive and time consuming
  - Security, privacy, ...

## What We Didn't Talk About

- Microarchitecture details (ALU, FPU, pipelining...)
- Memory bandwidth and latency
- Cache lines and cache coherence
- IBM (Power) or AMD processors
- FPGAs, Google TPUs, NPUs, ...
